

Loronix Video Manager™

Introducing the Next Level in Video Content Management Tools

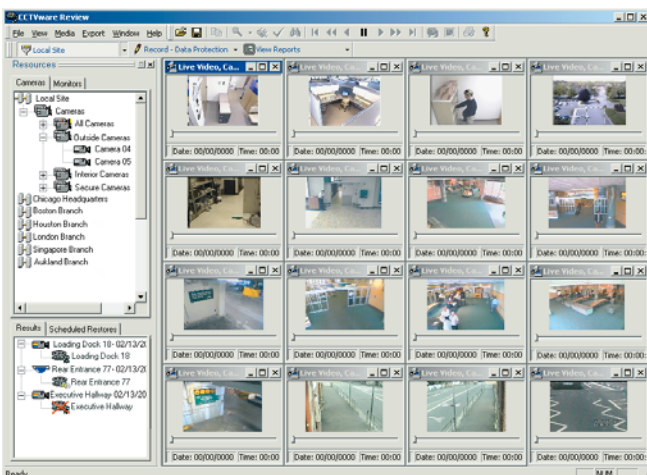

Loronix Video Solutions add intelligence to your video with our Loronix Video Manager™ software. This suite of tools allows you to control your entire digital video network from single or multiple locations. It also provides the platform software necessary to run Loronix Video Intelligence Modules™.

Each industry has its own unique challenges, and therefore specific requirements of its networked digital video solution. Loronix Video Manager software is scalable to meet the needs of each application. There are different capabilities and functions within the software making it a flexible solution for any market's needs.

Making Video Intelligence Accessible

The protection of lives and assets has more importance now than ever before. To provide the necessary security and do it within the constraints of fiscal responsibility, solutions that will provide actionable intelligence are vital. The implementation of a Loronix video solution with Loronix Video Manager and our Video Intelligence Modules will help companies gain this insight, allowing for faster and more informed decision making. Loronix Video Solutions generate video intelligence and deliver it for decision making at the right time, in the right place, to make a difference in the success of your security efforts.

Loronix Video Solutions can provide a high level of proactive security and surveillance. Through our Video Intelligence Modules, we generate actionable intelligence and deliver it to the appropriate personnel who can take immediate action. Unlike other video systems that merely record and playback, we provide analytical tools such as motion and behavior detection and tracking. Utilizing Video Intelligence Modules, security personnel can act on situations in real-time and potentially stop a security breach before it happens.

Synchronized playback of up to 16 windows

Our solutions can be connected to, and integrated with, other systems to increase the level of protection of lives and assets.

There is More to Surveillance Than Meets The Eye

Although the networked digital video system's main purpose is typically for surveillance, with Loronix Video Solutions an organization can realize additional benefits. The collection of video data can be further leveraged by applying our Video Intelligence Modules in non-traditional ways. An example of this is electronic business intelligence. In these exciting applications, the same video used for security and surveillance purposes can be analyzed and used to generate intelligence to assist in managing a business. Business intelligence can, for example, tell a bank or retail establishment when checkout or service lines are too long and additional staffing is needed.

By integrating Loronix Video Solutions with other business systems such as point-of-sale and/or bar code scanning, a highly sophisticated tracking system can be implemented for high-value merchandise, cash counting/handling areas, or to compare financial transactions to actual video of the occurrence. A point-of-sale (POS) system, for example, can be automatically linked to video of the transaction and management personnel can detect whether or not that item was actually returned or, an item of lesser value substituted. This type of fraud detection and prevention can have a significant impact on an organization's bottom line.

More About Loronix Video Solutions

Our dedication to research and development has allowed us to continually build upon the networked digital video system we pioneered in 1997. Today, we offer the Loronix Video Manager and a variety of Video Intelligence Modules, as well as integrations, to government authorities, public and private facility managers and commercial enterprises. These applications not only enhance security but also offer businesses a tool for improving operations and profitability. We have installed and helped to maintain global enterprise systems in over 36 countries.
